Welcome

Package: ChanningCGDS **Authors:** Vincent Carey [aut, cre] **Compiled:** 2025-07-17 **Package version:** 0.98.2 **R version:** R version 4.5.1 (2025-06-13) **BioC version:** 3.22 **License:** MIT + file LICENSE

This is the landing page of the **BiocBook** entitled ChanningCGDS (CGDS = Computational Genomic Data Science).

This book introduces the reader to collaborative approaches to learning and teaching about research methods in the domains of whole genome sequencing, transcriptomics, epigenomics, and “spatial omics” with ultimate focus on lung diseases.

Docker image

A Docker image built from this repository is available here:

ghcr.io/vjcitn/channingcgds

 Get started now

You can get access to all the packages used in this book in < 1 minute, using this command in a terminal:

Listing 0.1 bash

```
docker run -it ghcr.io/vjcitn/channingcgds:devel R
```

RStudio Server

An RStudio Server instance can be initiated from the **Docker** image as follows:

Listing 0.2 bash

```
docker run \  
  --volume <local_folder>:<destination_folder> \  
  -e PASSWORD=OHCA \  
  -p 8787:8787 \  
  ghcr.io/vjcitn/channingcgds:devel
```

The initiated RStudio Server instance will be available at <https://localhost:8787>.

4 Data structure concepts for genomic analysis

4.1 Self-descriptive data structures

4.1.1 Example: bulk RNA-seq analysis of smooth muscle treated with dexamethasone

[rnaSeqGene workflow](#)

[pubmed link to original](#)

[study](#)

4.1.2 Example: Zilionis Single-Cell RNA-seq in lung

4.1.2.1 Why is this “self-descriptive”?

-
-
-
-
-

4.1.2.2 Excursus: classes and methods

[SingleCellExperiment](#)

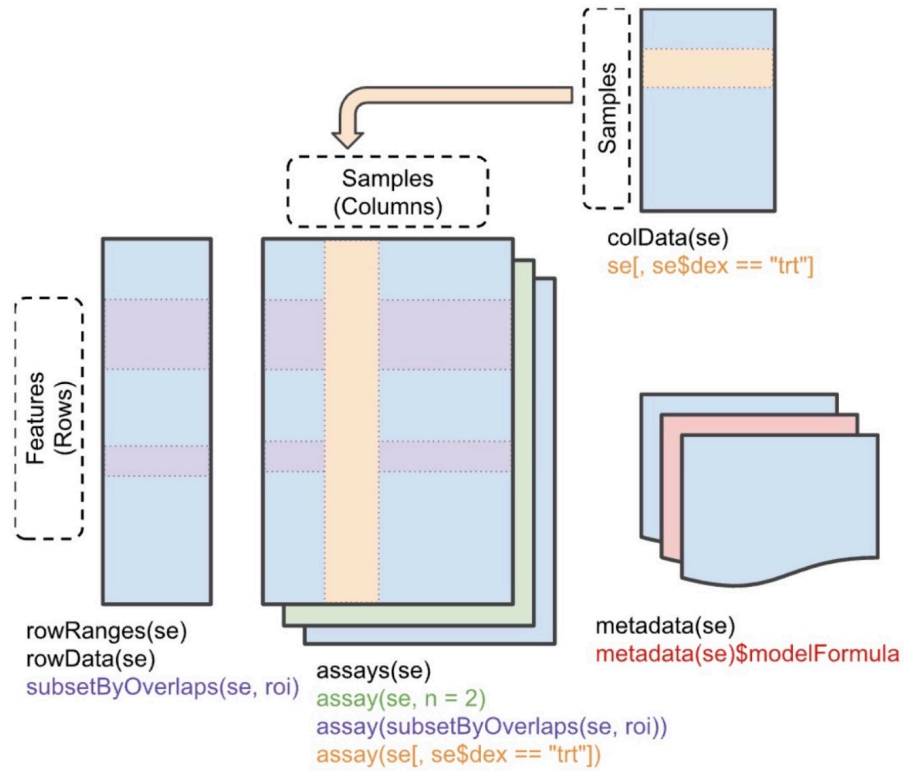

Figure 4.2: SummarizedExperiment schematic

•
•
•
•

```
class(zil)
## [1] "SingleCellExperiment"
## attr(,"package")
```

```
## [1] "SingleCellExperiment"
is(zil, "SummarizedExperiment")
## [1] TRUE
```

“S4 object-oriented programming”

```
allm = methods(class="SummarizedExperiment")
grep("assay,", allm, value=TRUE)
## [1] "assay, SummarizedExperiment, character-method"
## [2] "assay, SummarizedExperiment, missing-method"
## [3] "assay, SummarizedExperiment, numeric-method"
```

4.1.2.2.1 How does this represent useful binding of metadata to data?

```
table(zil$Patient, zil$Tissue)
##
##      blood tumor
## p1 12763 21243
## p2 15826 14873
## p3  8165 30794
## p4  4906 11907
## p5      0 14049
## p6  3964 11300
## p7  6981 17183
```

```
library(ggplot2)
rd = as.data.frame(reducedDims(zil)[[3]])
rd = cbind(rd, type = zil$`Major cell type`)
rdp = na.omit(rd) # many cells not used
ggplot(rdp, aes(x=x, y=y, colour=type)) + geom_point(size=.5)
```
